Event Handling

Mouse events 🔗

Event Name
auxclick
click
contextmenu
dblclick
mousedown
mouseenter
mouseleave
mousemove
mouseover
mouseout
mouseup
pointerlockchange
pointerlockerror
select
wheel

Keyboard events 🔗

Event Name
keydown
keypress
keyup

Focus events 🔗

Event Name
focus
blur

Form events 🔗

Event Name
reset
submit

Event handlers allow our code the ability to react when an event occurs.

ELEVATE YOURSELF

Three Pieces to the Puzzle

1. A DOM element where we want to listen for events
2. A specific event that we want to listen for
3. A function that holds the logic that we want to execute

Event Design Pattern (Named)

```javascript
let changeButton = document.getElementById('change-greeting');

  changeButton.addEventListener('click', (event) => {
    changeGreeting();
});

function changeGreeting() {
    let greetingHeader = document.getElementById('greeting');
    greetingHeader.innerText = 'Goodbye';
}
```

1. A DOM element where we want to listen for events

2. A specific event that we want to listen to

3. A function that holds the logic that we want to execute

ELEVATE A YOURSELF

Event Design Pattern (Anonymous)

- the name of the event
- the type of data structure used to represent key properties of the event
- the object that will 'emit' or 'publish' the event

```
let p = document.getElementsByTagName('p')[0];

p.addEventListener("click", (event) => {
    event.target.innerHTML = "Paragraph
Clicked!";
});
```

1. A DOM element where we want to listen for events

2. A specific event that we want to listen to

3. A function that holds the logic that we want to execute

Event Object

Property	Found In	Purpose
target	All events	Holds the element where the event was triggered. ie the button clicked or the select box changed.
tagName	All events	The name of the tag where the event was triggered. ie DIV, P, LI
clientX	Mouse events	The X coordinate on the screen of the event.
clientY	Mouse events	The Y coordinate on the screen of the event.
altKey, metaKey, ctrlKey, shiftKey	Mouse and Keyboard events	A boolean on whether the specified key was pressed down during the event
key	Keyboard events	The key that was pressed, taking the Shift key into account. Arrow keys show up as 'ArrowRight', 'ArrowLeft', 'ArrowDown', and 'ArrowUp'

Event Propagation

```
<div id="foo">
    <p>Inner mind</p>
</div>

let p = document.getElementsByTagName('p')[0];
p.addEventListener("click", (event) => {
    event.target.innerHTML = "Paragraph Clicked!";
});
let d = document.getElementsByTagName('div')[0];
d.addEventListener("click", (event) => {
    event.target.innerHTML = "Div Clicked!";
});
```
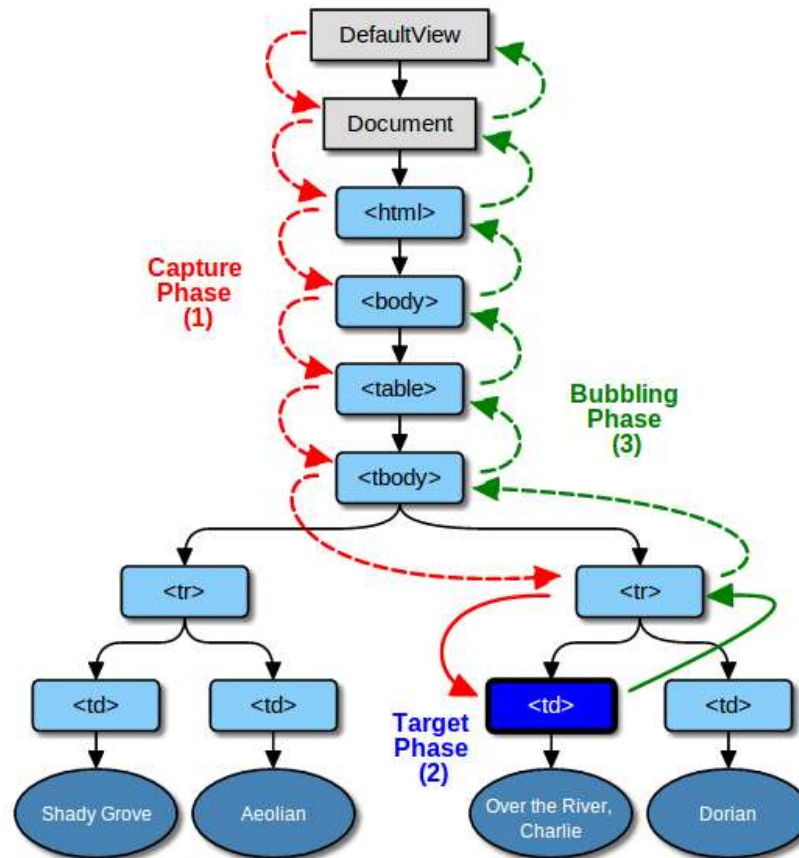

Event Propagation

Fig. 1 Graphical representation of an event dispatched in a DOM tree using the DOM event flow

When to add listeners

- Need to wait until the DOM is fully loaded

```
document.addEventListener("DOMContentLoaded", () => {
    // Register all of your event listeners here
});
```

LET'S CODE!
